

# Track Mounted Luminaire

## INSTALLATION MANUAL

⚠ Before beginning the installation of the luminaires, ensure that the track is wired and installed according to the provided instructions. When connecting the adapter, ensure it is installed in the correct direction to avoid any issues. Follow the steps below carefully, as connecting the adapter incorrectly may result in 400V being supplied to the luminaires.

- 1 Fix the non-electrical end of the adapter driver into the track.  
A distinctive click sound and feel indicates proper fixing.
- 2 Fix the electrical end of the adapter driver into the track.  
Make sure there is no gap between the track and the adapter.
- 3 Turn the handle to the locked position. If there is resistance in the handle, unplug the adapter as it is installed the wrong way. Choose phase 1, 2 or 3 by rotating the phase selector wheel.
- 4 Check and verify proper installation by ensuring that the non-electrical end of the adapter driver is locked.
